1000000002	20100101	01	1000000001	1000000001	200	98.00	19600.00

Sap t code list.

Some of them are required by SAP IBP during data post processing (e.g. \$G PLAN AREA, \$G SCENARIO, \$G TIME PERIOD, \$G BATCH COMMAND, \$G LOAD DATE). Eg KF1@PERPRODUCT + KF2@PROD, eg Attributes, PRDID, LOGID, CUSTID, RESID, SOURCEID, etc. Master Data Types - PRODUCT, CUSTOMER, etc. KFs: CONSENSUDEM, PROJECTEDINVENTORY, etc. This means that data for a particular run of a task may only be in the staging table for a matter of minutes - until the stored procedure is completed. A: No, data cannot be loaded into IBP REP tables. See "Master Data Types" from model configuration guide. Q: What does the start and end data in the time profile mean and how they are used, how the different past and future periods for the periodicities in the time profile mean and how they relate to the ones in the planning area? A: Time profile is made up of time profile levels, each of them being made up of periods. They can keep the old version of the Agent. If data is not available at this level, then it should be transformed before sending it to IBP. With that, you can also use older add-ins down to a specified version. Your Security Administrator can tell you what roles you've been assigned. Look at your trace and error logs to determine your next steps, not the Monitor Log. Q: History, View Page - While a task is running, why aren't the logs in the History page updated? A: The monitor log is refreshed every 10 seconds while the task is running. Use those two logs to know if it failed on load (typically this will log JDBC error), or on post processing - IBP may return an error from the data upload stored procedure. Q: Monitoring Log - how to interpret the State column - At different times you have observed different values for the "State" field. Note that the Custom Alert functionality requires licensing Supply Chain Control Tower module in IBP. You cannot change the execution order of dataflows for a given target table. A: Click the Refresh button in the upper-right corner of the page to see an updated status. This method is not suited for large uploads and not recommended for production systems. Q: Can IBP connect to other SAP and non-SAP applications? A: IBP can receive inputs from various SAP and non-SAP applications via data integration tools. This name needs to be enclosed within single quotes as it is a constant (e.g. 'SOPMD\_STAG\_SMICUSTOMER'). What are the existing options for removing duplicate entries? A: Based on the business need, there are several ways: By using "ABAP Aggregation" or "Aggregation" transform with a group by on key columns and use aggregation function in others (e.g. max(date), sum(quantity), ...). By selecting the checkbox "Select Distinct Rows" on the filter tab of your Query transform (in case the records are identical in all fields you select). A: SAP Cloud Platform Integration for data services cannot use different system sources in one task, but allows lookup in a datastore that is not the source datastore (reading from ERP and looking up for mappings into a flat file). Q: Join - When performing a Join in a dataflow - what is the number of joins that I can perform? A: Number of tables in the "Input Data" minus 1 is the number of joins you can do in the dataflow. Q: Multiple Tables: How efficient is SAP Cloud Platform Integration for data services at performing runtime logic involving multiple tables? A: When joining multiple tables, SAP Cloud Platform Integration for data services will generate an ABAP program (for ERP) or a SQL statement (for databases) so that the processing of the joins is pushed to the source. For more information please refer to, SAP Help Portal - Integrated Business Planning - Use - Application Help for SAP IBP for Supply Chain (Current Release) - Business Applications - Demand Planning - New Product Introduction. Q: If building from scratch, what master data should follow a naming convention referring to the standard model SAP4 so that supply planning operators can be used at a later stage? A: Refer to application help on Supply Planning . It is the main planning UI that is used by most of all SAP IBP customers. If a job fails, what you care about is the error log and the trace log. Sysdate() returns the date and time in the local time zone of the SAP Data Services Agent machine while IBP tracks time as UTC (Universal Coordinated Time). This feature is to protect the security of your data. A: Go to SAP Support Portal. Component LOD-HCI-DS. Also, a Planning Level can include a root attribute coming from a Compound Master Data Type where this attribute is not a key. One agent can be connected to many different systems. Once the IBP stored procedure has finished the data that had been loaded into the staging table will be deleted. You need to check for Null conditions eg ISNULL(KF2@PROD). For more information please refer to Model Configuration Guide - Advanced Modeling Topics - Cross Period Calculations. Q: Where can I find documentation for L-Code? A: L-Code is internal to SAP and there is no documentation available. There is a foreign key relationship between the keys of the compound and the referenced master data types with individual keys. Based on the Planning Area Settings if an attribute of a compound master data is chosen as mandatory then data will not be loaded for a key figure unless a corresponding master data entry exists in the compound master data type. Q: How do we use compound master data in planning levels build? A: For planning levels which include primary master data types like Product and Customer, the Compound Master Data Type "Customer Product" should also be included so that the Market Size and Market Revenue attributes are available. In some cases master data loaded via SDI can be reused for time series based planning. Another option for upload, mainly in the beginning of the project when interfaces are not ready, is Data Integration app available in IBP web UI. E.g. you can schedule daily or weekly uploads. Q: Controlled Release for running a dataflow: How would a user do this? A: This can be done via SAP Cloud Platform Integration for data services UI - the "Run now" button (instead of using the scheduler) or from IBP Application jobs app. Q: Run Time Parameters: Can a user define the variables to pass the run time parameters for the fields? A: Yes, variables are supported and can be set at execution time. Q: Can a job be scheduled on a specific day e.g. every last Sunday of the month? A: Yes, what can be done is to schedule the task every Sunday, but in the pre-load script do some checks and if not the last Sunday of the month terminate execution. For a task based on a template, once imported in the sandbox repository, developers can completely customize the template; SAP Cloud Platform Integration for data services does not have any restrictions here. The task can still be executed if validation has only warnings. Then you just add it as a favorite or template. If you need transfer between different planning areas, you need to have an empty template (i.e. the chart, the hidden sheets, the header information etc., but no planning view in it). Any recommendations? A: The performance of the planning views depends on multiple different areas, e.g. the SAP IBP backend, network, the hard- and software of the PC, the data volume, formatting rules, etc. That also means that there is usually a lot of potential for performance optimization. We have summarized our performance best practices in a document that is attached to the SAP Note 2153455 - S&OP / IBP Excel Add-In: Planning View Performance Recommendations. Edit any ABAP Query in the Dataflow, and Go to the ABAP Options tab. In case you need help, please don't hesitate to reach out to our support team in this regard by opening a support ticket on component SCM-IBP-XLS-UI. In addition, please refer also to SAP Note 2108186 - S&OP / IBP Add-In for Microsoft Excel: Recommended Sizes for Planning Views: 2108186 Q: I want to train my users on the SAP IBP Excel add-in. Reference Master Data Type is master data type that refers to another master data type. Create Role2. This is performed from the Dashboard Action menu. Q: Can I create more than one drilldown path for the same chart? A: Yes. Q: Is there a limit for the number of levels in a drilldown? A: Yes, you can create up to 15 level charts in a drilldown path. When you share a dashboard, all the content (charts, alerts, alert overviews and supply chain networks) of the dashboard is shared implicitly. Q: Is the dashboard filter values applied to all its components? A: Yes, the dashboard filter is applied to all charts/alerts/alert overviews. The code should be something like below: IF ((last\_date(sysdate)) - sysdate()) < 7) Print('This is the last Sunday of the month'); ELSE Raise\_Exception('TASK WILL NOT EXECUTE - not last Sunday of the month'); Logs: Monitoring Log, how to interpret the Row Count - How do you interpret the split between two different queries - a Target Query1 and a Target Query\_Mapping? Click the Refresh button in the upper-right corner of the page to update the Trace Log and Error Log. Before sending them into IBP it is required to aggregate the values for the weeks that fall within same month. This involves typically many more steps and calculations than just updating the data loaded into the IBP staging tables, validates the data, and if data passes the validations, it writes them to the IBP core tables, which have a structure that's different from the core tables. A: No, SAP Cloud Platform Integration for data services has 2 adapters, created by the dev team: one for SuccessFactors, one for OData. The IBP REP tables are purged periodically as well (default: after 7 days). CPI-DS - Administration? SSO support: Is SSO supported with SAP Cloud Platform Integration for data services? A: We do have SSO with SAP ID Service. For more details please refer to "Time Profiles and Time Periods" from the Model Configuration Guide. Q: What are my options to disaggregate based on a calculated Key Figure at a different planning level? A: Before calculated key figures can be used for disaggregation, they must be copied into another stored key figure at the same base planning level as the key figure to be disaggregated. Tip: After the task has been unlocked, if needed, refresh the Projects tab. CPI-DS - Data flows syntax? X: It is possible to have translation (mapping) tables maintained in SAP Cloud Platform Integration for data services? A: No, SAP Cloud Platform Integration for data services is not designed to store data. This allows you to review error & success for individual rows. It is used to join two or more MDTs with a join condition. In the Global Configuration app, under Parameter Group: ANALYTICS, the BUFFERING parameter value setting is set to TRUE by default. This column needs to be mapped to a constant that contains the target table name. Refer Model Configuration Guide - Split Factor Calculation and Planning Operators. A: You can generate statistical forecast for a new product based on the history of like products. Next, SAP Cloud Platform Integration for data services is used to read the file/stage table and map to IBP. And incorporate it into the same planning area? A: Yes. Q: Possibility to copy KF across different planning level? A: Calculations can be defined to copy KF values across planning levels. This means that disaggregation works only if the disaggregation key figure can be calculated at the base planning level of the to-be-disaggregated key figure. CPI consists of two different parts: SAP Cloud Platform Integration for process services (old name SAP Hana Cloud Platform, Integration Services for process integration, often abbreviated with HCI or HCI-PI) / SAP Cloud Platform Integration for data services (old name SAP Hana Cloud Platform, Integration Services for data services, often abbreviated with HCI or HCI-DS) so if people talk about HCI they might mean one of the two parts of CPI. These best practices are updated every quarter when SAP IBP is upgraded. SAP IBP Best Practices can be

downloaded from SAP IBP Best Practices? What happens if we copy one of the SAP Sample Planning Areas into a new Planning Area, if it uses an attribute whose length was already changed? This attribute should be available for all Customers belonging to the Customer Group. For details how to use the app and what are the prerequisites please check this relevant page from Model Configuration: The user can create an alert definition for a combination of rules that determine if an alert should exist, the time period for determination, and the level of aggregation for determination. The templates delivered by IBP have been created for extractors using subscriber S&OP or IBP. With the sheet option Keep Formula on Data you can keep those formulas in the planning view; Q: I entered a calculation directly in the planning view, why is it not automatically converted into local member? A: The formula is automatically converted into local members only if the Local Member Recognition feature is activated via the About Group > Settings > Options... ->Activate Local Member Recognition.Model Configuration? Where can I find the Model Configuration GuideA: Model Configuration Guide is updated after each release of SAP IBP. The Model Configuration Guide can found, and also be downloaded from the help page SAP Help Portal - Integrated Business Planning – ImplementQ: What are SAP IBP Best Practices and where can I get themYou can leverage SAP Best Practices for SAP Integrated Business Planning for Supply Chain to get an entry scope of the planning processes of sales and operations planning, response and supply planning, demand, Inventory Optimization and Control Tower. The name of the extractor in the datatore is a concatenation of the extractor name and the subscriber separated by an underscore. These periods are time intervals defined by an individual start and an end date for each period. The purpose of this document is to report important questions that come up during IBP implementations in application areas like Excel Add-In , Model Configuration, Analytics , Process Management, System Setup and Transports, Releases and Data Integration. The system is designed in that way to avoid back-end deadlocks during the process and so that the activation process itself is also faster.Q: How do I copy and activate a SAP delivered planning area?A: For guidance on how to copy SAP delivered planning area please refer to Model Configuration Guide --> Copy Options for Planning AreasFor guidance on how to activate SAP delivered planning area please refer to Model Configuration Guide --> Activating Planning ModelsQ: How do I model material dependent Unit of Measure conversions?A: The base UOM can be modeled as an attribute of the Product Master. Unmapped columns in the Output pane of the Target Query may use a warning when validating a task. 2) But, once tasks are tested and an Administrator moves them to production, no changes (at all) are allowed in the production repository. There is currently no framework to plugin additional adapters.Q: Third party ETL: Can 3rd party ETL loads data directly into IBP Staging tables?A: SAP Cloud Platform Integration for data services is the only system-to-system integration tool that can load directly into the IBP staging tables (because SAP Cloud Platform Integration for data services is physically installed in the same datatcenter as IBP).Q: Does on-premise data services have to export a flat file and that flat file is imported in IBP. SAP delivers some example empty templates with SAP Note: 1790530 S&OP / IBP Planning View Templates for the Excel Add-InQ: If multiple users are using the same data, how do table locks work? A: To avoid blocking users unnecessarily there is no locking on application level. Pro and cons of it.A: This decisions completely depends on the business blueprint identified during the blueprint phase. The periods that are part of this horizon are available for selection in the planning view - time settings. Additionally, all folders you want to read from need to be "white-listed" in the agent configuration tool (only root folder needs to be white-listed, sub folders will be accessible automatically).Q: Agent Upgrades: When is it necessary?A: For tasks running in production, SAP does not require customers to upgrade their agent. Create Business User3. System configurations group datatore configurations from different datatores together as one logical entity.Q: How can I view data in SAP Cloud Platform Integration for data services ?A: From the Datatores tab, select your IBP datatore and then the target object. Key figure alerts are visible only in the Excel UI. If the planning areas are identical (e.g. the same planning area in your test and productive system), you log on to the one you want to copy from, load the planning view, log off, log on to the one you want to copy to and refresh. Create a Test planning area and development planning area? A: Usually Cloud environments have a Test Tenant and Production tenant. So performance depends on your source system, not on SAP Cloud Platform Integration for data services. There are also some detailed IBP FAQ Wiki pages on the main IBP Wiki page: SCM Integrated Business Planning (IBP). Moreover, when you upload the program in SAP Transaction SE33 you must use the name specified in the ABAP Query. Instead, you can use lookup into file functionality.Q: Is there any standard function to convert weeks to months?A: There is no function for week to month transformation as we cannot tell start date and end date of a week from the WW YYYY syntax. Program names must be less than 40 characters and start with 'Z' or 'Y'. So the username/password is not stored in a configuration file. You can also click on Help in the Administration Page for a description of each role and which privileges it has.Q: It is an open SAP system required with "Generate and Execute" mode?A: Yes. That means you can usually display results for a key figure at base planning level (if this is your request level) or any aggregated (request) level according to the defined configuration. For scheduling a task, in the UI, you can set the time zone you want to use to schedule your task (behind the scenes CPI-DS will convert to UTC and store this in the repository).Q: If I check integration job log in IBP Data Integration app, I see that Start At and End At are reported in different time zones. (on-premise to IBP).A: Key Figures must be loaded and the granularity given by the base planning levels (attributes marked as Root in the planning level). You can for example:Add VBA code such as data validation steps at certain points of the process, for example when a planning view is saved or refreshed or when a master data workbook is saved and refreshed. As of the SAP IBP Excel add-in version 2005.2.0, we introduced a desktop shortcut which automatically enables the SAP IBP add-in and checks and sets the relevant registry keys if needed. There are two relevant SAP Notes in this context: and . So for files, SAP Cloud Platform Integration for data services recommends NOT to join large files.Q: Source Systems: Can you load the same master data table from 2 different systems? Example is...You want to load ID + attribute 1, 2 & 3 with one batch, next you want to load the same IDs with attribute 4, 5 & 6. It is required when the underlying data is the same but can play different semantic roles and you want to avoid loading the same data twice. Set the global variable to SYSUTCDATE().CPI-DS - Tasks and data flowsQ: How can we run the task vs SAP Test environment?A: Your Test and Production systems will not be open for modifications, so you cannot use the "Generate and Execute" mode. If more than one SAP IBP module is implemented one should use the Unified Planning Area, SAPIBP1, as a starting point. However, as pointed out earlier most customer start the implementation with SAP Delivered sample models.Q: Data does not show up in Versions, though the same appears in baseline. More comprehensive details of each model are available in the help documentation, under, SAP Help Portal - Integrated Business Planning – Use – Application Help for SAP IBP for Supply Chain (Current Release) – Business ApplicationsQ: Do different application modules like Demand, Inventory etc. Developers have privileges only in the sandbox environment; Production Operators have privileges only in the production environment. There you will find an overview slide deck.Q: What are the data integration options to and from IBP?A: SAP Cloud Platform Integration for data services (CPI-DS) is the recommended data integration tool to load time series data to IBP on-demand and to extract data. As a best practice, it is recommended to test the performance when multiple business users work in parallel on the same server that are rendering and saving data to make sure the server (e.g. CPU and RAM) is sufficiently sized. Q: How can I install the IBP Excel add-in on a MacBook? A: You need to have a virtual machine with Windows and Office set-up on your MacBook in order to install the IBP Excel add-in.Q: Can I use the IBP Excel add-in with the Google Suite? A: No. This set-up is not supported. In order to be able to select a different configuration at run-time, you also need to create system configuration. The graph ends with request level nodes, which are the ones that a user queries from the IBP Excel UI or IBP Analytics. Configure the Model (Attributes, Master Data Types, Time Profiles, Planning Area, Planning Levels, Key Figures, and Scenarios)4. Usually the contract covers a Test and a Production Tenant.Q: Do customers have to buy JAM separately?A: Yes, JAM is a separate license from IBP.Q: Is IBP a cloud only solution or is there an On-Premise option? A: SAP IBP is only available in the Cloud version.A: Being on-demand (subscription based), updates are included for paid customer/partner systems. A new release of SAP IBP is released every
quarter. The customer Test server is first upgraded, and later the Production Server also is upgraded to latest release. SAP IBP team communicates with the customers on the upgrade schedule.Q: How to work in Cloud environment in terms of system architecture? Activate the Model (Time Profile, Master Data Objects, Planning Areas)5. It is strongly recommended to upgrade the IBP Excel add-in at least once a year to keep up with the latest developments and innovations. Q: Is there a way to distribute the IBP Excel add-in to all my business users centrally? A: Yes. You can only change the order of target table execution. For a successful load, the sum adds up to the full count of records. Tasks can be created from scratch, or they can be based on a template. In the Monitor Log, it is the very last line where you see where the file was written to (your Target Table). The rest of the information listed is internal to the engine used by the SAP Data Services Agent. The columns in the Output pane reflect the schema for the target object.Q: Save Actions - When are my actions saved? A: In the Data Flow view, actions are periodically auto-saved so your interim changes are retained. Please refer to the SAP Note 2135948 - Install the S&OP / IBP Excel Add-In: Supported Configurations / Prerequisites: 2135948Q: Can I install the IBP Excel add-in in a Citrix environment?A: Yes. It does not contain actual master data but simply refers to the data contained in its underlying Master Data Type. The end user applies the alert in the Excel UI for the current planning view / filter.Custom alerts are end-user configured alerts via Fiori apps. 2LIS\_11\_VASCL or 2LIS\_12\_VCITM, but also a subscriber. After the stage tables are loaded, SAP Cloud Platform Integration for data services task calls the IBP stored procedure. How do I unlock it? A: Only one user at a time may edit a task. I got a message that says " is an invalid ABAP program name. But please be aware that SAP is constantly improving the features, performance, stability, and security of its products. You can also build your own view to focus on few alert subscriptions by using the Define Custom Alerts Overview appQ: When is an alert buffered? A: A chart is buffered when it's created for the first time or updated. Furthermore, in the Global Configuration app, under Parameter Group: ANALYTICS, the BUFFERING\_NB\_SECONDS parameter defines a threshold of time to determine when an alert subscription needs to be buffered. For example, if the BUFFERING\_NB\_SECONDS is 3, the system will buffer the chart if the extraction time is more than 3 secondsA: There are two ways to update the buffer:By refreshing your chart manually in the Target Table. (e.g ECC DEV / ECC TEST)A: Yes, you can maintain multiple sets of datatore parameters. Or you could lookup into a table where this information is maintained. It cannot be used to load or send any time series data. Again show what the refresh icon looks like.CPI-DS - Cross Topics A: No, SAP Cloud Platform Integration for data services cannot access Bex queries, so if the data is only available in Bex (e.g. as calculated key figures), you would need to export the data in some way and store in a table or file and let SAP Cloud Platform Integration for data services access the table/file.A: SAP Cloud Platform Integration for data services can read the data from the DSO tables (via the ABAP layer, no database access needed.)Q: 2 tables - If the master data (Product & Customer) is stored in custom database tables in ECC, can SAP Cloud Platform Integration for data services read these data?A: Yes, SAP Cloud Platform Integration for data services can read the data from custom 2 tables (via the ABAP layer, no database access needed.)A: Yes, SAP Cloud Platform Integration for data services supports the delta extractors from SAP Business Suite applications.Q: ECC - Sending data back: Can a user be sending back data to ECC such as forecast?A: SAP Cloud Platform Integration for data services can write back to a file or database table. SAP Cloud Platform Integration for data services has a role-based architecture. In general it is sufficient to use one subscriber ID, but if you need to replicate the same delta information several times, for example in case they are used in different planning areas, you should define several subscribers for the same extractor.Q: What are the Global Variables?A: Global variables are symbolic placeholders that are populated with values during task runs. The Windows user that is used to run the data services agent service must be a domain user that has access to the network locations you want to read from. Further information can be found in the application help > search term: Installing the SAP Integrated Business Planning, Add-In for Microsoft ExcelQ: How to install the IBP Excel add-in and create a logon? A: Refer to the application help > search term: Setting Up the SAP Integrated Business Planning, Add-In for Microsoft Excel (Administrators). Next the file is automatically sent to the NetWeaver server, executed and the results (data) are sent back over RFC to the agent. The subscriber is especially important for delta enabled extractors. How can I correct this? A: This gap will appear if the global variable SG\_LOAD\_DATE is set to SYSDATE(). Transforming the data directly is SAP Cloud Platform Integration for data services is also possible, being just a matter of math and date time function.Q: What are the mandatory fields to be mapped in an inbound data flow? Usually, the customer has a table in their system that gives the start dates and end dates of a week. Please refer to the SAP Note 2135948 - Install the S&OP / IBP Excel Add-In: Supported Configurations / Prerequisites: 2135948Q: How to do I get started with a planning view sample template? A: SAP is providing sample planning views that can be used as a quick starter for your project that include a basic formatting sheet, and in some samples also VBA code and charts. In IBP the main integration middleware is CPI-DS and SDI, not CPI-PS.CPI-DS - SAP Data Services AgentQ: How many SAP Data Services Agents are needed per customer?A: SAP Cloud Platform Integration for data services (CPI-DS) needs only one agent per customer. For a complete list and descriptions of Global Variables, please refer to SAP IBP Help Landing Page – Integrate – SAP Cloud Platform Integration Guide.Q: Global Variables: Can I change/edit the name of an existing Global Variable?A: If you enter an incorrect name for a Global Variable and you save this, you cannot edit this name for the Global Variable. Unmapped columns in the Target Query may or may not be relevant. All complex data processing in this case can be done in the on-premise ETL tool, SAP Cloud Platform Integration for data services is only used for the final mapping to the IBP tables.Q: Timeout Period - Is it possible to configure the setting for the timeout period?A: No. Your session will automatically time out. However, Join condition information must be specified saved by clicking the Save button. You can use these as a base and add your own custom coding and content on top.Refer SAP Note: 1790530 S&OP / IBP Planning View Templates for the Excel Add-InQ: I want to optimize the performance of my planning views. It is recommended to already follow these practices during implementation. At query time the graph is evaluated from request level to stored key figures to determine what needs to be read and then in the reverse order to do the actual calculations.Usually the base planning level is the most detailed planning level for a key figure. Load Master Data, Time Periods, and Key Figures6. The following languages are available as version 2102.2.0ArabicChinese (Simplified)EnglishFrenchGermanHebrewHungarianItalianJapaneseKoreanPolishPortugueseRussianSpanishTurkishUkrainian:A This happens usually after excel session has closed unexpectedly or crashed. There are no code exits but in practice most calculations can be performed through configuration. For updates of Agents, there is no auto-update. This attribute can be root of a planning level such as Product - Forecast Location.Q: What is a virtual master data type and how is it used?A: Virtual Master Data Type doesn't store data but models a relationship between other master data types. This is only valid for Sandbox environment, view data in production is not allowed for security reasons. Note: If View Data is not available in you sandbox target datatores, contact SAP Support and request that they activate View Data functionality on your target application. You may need to verify your specific requirements. The only changes in production would be configuration changes like the connection parameters (connect to prod ERP and prod IBP instead of test systems) or variables (e.g. a variable filter to set a start date of which data to extract).A: When loading an extractor to a datatore you not only can specify the extractor name, e. For more details, check "Planning Operators" from the Model Configuration Guide. The refresh button is the two swirling arrows rotating in a circle.Q: Locked by User - A task that I want to edit is locked by another user. It provides options to download csv templates of Time Profile, Master Data and Key Figures, which you can then fill with data and upload. You can package the IBP Excel add-in and then distribute it via silent installation. The Rudiger Meyfarth (r.meyfarth@sap.com) and Vivek Sinker (v.sinker@sap.com)Planning with IBP Excel Add-In.Q: Do I need to install the IBP Excel add-in to use the SAP IBP system?A: No. However certain features are only available in the IBP Excel add-in. In this case an inner join is performed and KF26PERRPROD value will be available at plan level PRODCUST. For example, consider "Product" and "Component". The guide can be used for end user trainings as well. Q: Can I extend the functionality provided in the IBP Excel add-in? A:
Yes. However, if a column is required in the target stage table, you will get an error at task run time.Q: Copy a Task - Can I copy a data flow to a different task? A: Yes - Highlight your dataflow, and from the actions menu, choose REPLICATE. Use Excel Add-In to view/change data7. To find more details on Templates, please go to SAP IBP Help-Landing Page – Integrate – SAP Cloud Platform Integration Guide. This Integration Guide has details on the Templates.Q: Template - For a template that was used in a task and that task was loaded and placed into production, can that task and template be modified?A: 1) Tasks are developed in the sandbox environment, never in production. Click the View Data icon (I). This is applicable to all modules that are using time series planning (all modules excepting Response piece). For order based planning in Response SAP Smart Data Integration (SDI) is mandatory. Are these usernames and passwords downloaded in the Agent configuration file?A: The username/password entered in the Agent Configuration tool is only used for the initial connection from the agent to the server, once the initial connection is made, the agent is "trusted" by the server and the username/password is no longer needed. This will allow loading transactional key figure data in the base unit of measure. Another option that would allow specifying the unit of measure at the time of data load would be modeling UOM conversion similar to currency conversion (maintaining the base UOM as a planning level root attribute).Please refer to the definition also contains which data should show with the alert, such as metrics and complementary charts. This document covers frequently asked questions from Consultants, Partners and Customers about SAP Integrated Business Planning Solution. If you have additional questions that need to be added, please contact Rudiger Meyfarth (r.meyfarth@sap.com) and Vivek Sinker (v.sinker@sap.com)Planning with IBP Excel Add-In.Q: Do I need to install the IBP Excel add-in to use the SAP IBP system?A: No. However certain features are only available in the IBP Excel add-in. Another option that would allow specifying the unit of measure at the time of data load would be modeling UOM conversion similar to currency conversion (maintaining the base UOM as a planning level root attribute).Please refer to the definition also contains which data should show with the alert, such as metrics and complementary charts. This document covers frequently asked questions from Consultants, Partners and Customers about SAP Integrated Business Planning Solution. If you have additional questions that need to be added, please contact Rudiger Meyfarth (r.meyfarth@sap.com) and Vivek Sinker (v.sinker@sap.com)Planning with IBP Excel Add-In.Q: Do I need to install the IBP Excel add-in to use the SAP IBP system?A: No. However certain features are only available in the IBP Excel add-in. In this case an inner join is performed and KF26PERRPROD value will be available at plan level PRODCUST. For example, consider "Product" and "Component". The guide can be used for end user trainings as well. Q: Can I extend the functionality provided in the IBP Excel add-in? A: Yes. However, if a column is required in the target stage table, you will get an error at task run time.Q: Copy a Task - Can I copy a data flow to a different task? A: Yes - Highlight your dataflow, and from the actions menu, choose REPLICATE. Use Excel Add-In to view/change data7. To find more details on Templates, please go to SAP IBP Help-Landing Page – Integrate – SAP Cloud Platform Integration Guide. This Integration Guide has details on the Templates.Q: Template - For a template that was used in a task and that task was loaded and placed into production, can that task and template be modified?A: 1) Tasks are developed in the sandbox environment, never in production. Click the View Data icon (I). This is applicable to all modules that are using time series planning (all modules excepting Response piece). For order based planning in Response SAP Smart Data Integration (SDI) is mandatory. Are these usernames and passwords downloaded in the Agent configuration file?A: The username/password entered in the Agent Configuration tool is only used for the initial connection from the agent to the server, once the initial connection is made, the agent is "trusted" by the server and the username/password is no longer needed. This will allow loading transactional key figure data in the base unit of measure. Another option that would allow specifying the unit of measure at the time of data load would be modeling UOM conversion similar to currency conversion (maintaining the base UOM as a planning level root attribute).Please refer to the definition also contains which data should show with the alert, such as metrics and complementary charts.
